

**Objective:** To observe the performance of Sealux-N in forming an adhesive bond with the red tinged siliconized face of the HydroHALT strip.

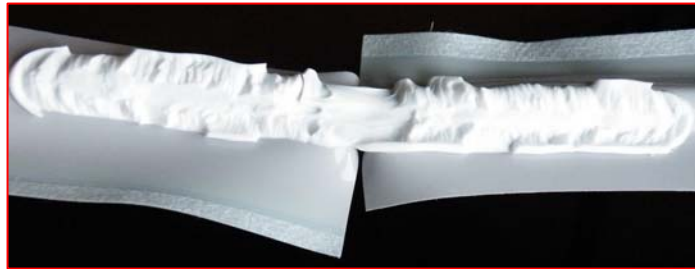

[Peel Test 2  
Video Clip](#)

**Set-up (photo 1):** A line of Sealux-N 65mm long x 12mm wide was sandwiched between the red tinged siliconized faces of two layers of HydroHALT and allowed to cure.

**Test: (photos 2-4):** The two layers of HydroHALT were peeled apart to simulate the effect of a tensile force (joint expansion) on the bond formed between the Sealux-N and the red tinged face of the HydroHALT strip. **Video 5** is a film clip of a second adhesion test showing two HydroHALT strips bonded together with Sealux-N being peeled apart.

**Observations:** The adhesion between Sealux-N and the adjacent HydroHALT strips was strong enough to cause uniform splitting in the Sealux-N sealant between the two HydroHALT strips when peeled apart.

## Test Report July/314

The report information provided herein is formatted by Sealux with an emphasis on photographs and video to accommodate the curiosity of normal consumers rather than experts skilled in the art of deciphering columns and rows of test data.

The performance observations made herein are supported by the respective test images shown which we believe are a transparent and a repeatable means of substantiating the unique capabilities of the HydroHALT Sealing System.

## Installers

Shower tray, bath and wall surfaces will differ from installation to installation.

Installers should satisfy themselves before installing the HydroHALT Sealing System that surfaces onto which Sealux-N is being applied are clean and structurally fit for purpose.

Some acrylic shower trays, particularly those with a hi-gloss surface finish may not accommodate adhesion with sealants.
